The research is not complete, but it could be that choosing a place where people like to fish or where there are critical aquatic organisms that make up the bottom of the food web might not ...

Engineers must consider multiple factors: systems have to ...

The idea of putting solar panels on top of the world's thousands of miles of irrigation canals has long seemed like a good one.

Floatovoltaics-- or solar panel installations built to float on bodies of water -- are emerging as a useful tool in the world's quest to ramp up renewable energy sources and cut greenhouse gas emissions.

"By covering canals with solar panels, we can reduce evaporation and avoid disturbing natural and working lands, while providing renewable energy and other co-benefits," says environmental ...

Despite these challenges, pairing PV and water infrastructure has enormous potential to help re-stabilize water supplies in the Colorado River and other drought-stricken regions around the planet.

The idea is simple: install solar panels over canals in sunny, water-scarce regions where they reduce evaporation and make electricity.

Floating solar panels are one notable choice, designed to sit atop the water's surface and harness sunlight without occupying valuable land. This option offers several advantages, including ...
