Does Kingston have a testing system?

Kingston employs a multi-tiered testing system to ensure quality control throughout the design and manufacturing process. Kingston's testing process combines: This complete package makes for the consistent product reliability and compatibility that Kingston customers have come to depend on for more than two decades.

What is Kingston's testing process?

Kingston's testing process closely follows its engineering and quality process, DCAT (Design, Components, Assembly, Test). The modules are tested at each stage of development. Kingston puts each new module prototype through a rigorous testing process to ensure the reliability, integrity and compatibility of its design.

How are Kingston modules tested?

Next, the modules are tested on the system motherboard with the application software and operating systems most commonly used in the market. Kingston engineers test the modules on system boards with real-world applications. During this test, engineers also run benchmark tests on modules using the independent benchmark tests.

How many cells does Kingston Test?

Kingston has always had an unwavering practice of 100-percent production testing of all finished goods. This means testing every cell on every chip on every module. On a 16GB module, that is 137 billion cells. Kingston utilizes several different types of testers in our production testing process.

Our technicians do a battery load test as part of the 65 Point Vehicle Inspection Report that comes free with every car service. If you have concerns, we can do a stand-alone battery test and inspection ...

Batteries are sometimes pushed past their limits as part of testing, Kingston said, leading to their damage or even full destruction. As the batteries are encased in the equipment, researchers ...

Getting Started  
Design and Engineering Validation Tests  
Specification Test  
Compatibility Test  
Software Benchtop Test  
Signal Quality and Integrity Test  
Reliability Tests  
Guardband Test  
Ate (Automatic Test Equipment) Specification Test  
Dram Qualification  
Each product family goes through a two-step reliability test. The first puts the module through a series of calibrated hot and cold cycles for up to 1,000 cycles. Next, the module is subjected to a temperature and humidity stress test for up to 1,000 hours.
