---

A wind turbine consists of five main parts and many smaller parts. The main components are the foundation, the tower, the rotor and hub (including three blades), the nacelle, and the generator.

Read all about the wind turbine: what it is, the types, how it works, its main components, and much more information through our frequently asked questions.

Discover the main components of a wind turbine and how each part works together to generate electricity. Explore inside a wind turbine and emerging trends.

Understanding the individual components of a wind turbine--foundation, tower, rotor, nacelle, generator, and control systems--is essential because each plays a critical role in harnessing and converting ...

From the stable foundation to the flexible yaw system, from the energy-converting generator to the precise wind speed and direction monitoring devices, they form an efficient and ...

Inside the generator, there are two main components - the rotor and the stator. The rotor is all the bits that rotate, and the stator is all the bits that don't.

Which Five Parts Make Up A Wind Turbine? A wind turbine is a complex system consisting of five major components: the foundation, tower, rotor and hub (including three blades), ...

A wind power plant, also referred to as a wind farm, includes multiple wind turbines in the same general area. As the wind turns the turbine blades on each turbine, the blades turn a rotor, ...
