How do I install solar panels?

Ground-mounted panels can be installed anywhere with good sun exposure and enough open space. A minimum of 350 square feet is usually required. Installing solar panels requires the following steps: Plan the solar energy system based on the home's size, location and energy needs. Measure, cut and assemble the support structure for the solar array.

Where should a solar panel be installed?

It is very important to install your solar panel at location that gets the most direct sun exposure. Solar Panels perform at optimum capacity when placed in direct sunlight. When you install your Solar Power system, try to position your photovoltaic panels directly under the noontime sun for maximum efficiency from your photovoltaic unit.

How do you activate a solar system after installation?

After solar panel installation, the system needs to be activated. This involves interconnecting the solar panels, installing the inverter, and commissioning the system. During this step, note that as long as the solar panels are receiving sunlight, they have an open circuit voltage. Be careful when handling them.

How do I install a solar power inverter?

Install solar modules, panels and support structures according to local building codes and standards. Connect the solar power inverter to the electrical system. Apply weather sealant to the equipment being installed. Activate and test solar energy systems.
