In this report we demonstrate a new and versatile photovoltaic panel cooling strategy that employs a sorption-based atmospheric water harvester as an effective cooling component.

In this study, a phase-change material (PCM) is used to cool the PV panels, and fins are added to enhance PCM heat transfer. Using numerical simulation, the effects of fin spacing, fin ...

Maintaining constant surface temperatures is critical to PV systems" efficacy. This review looks at the latest developments in PV cooling technologies, including passive, active, and combined ...

In order to reduce the adverse effects associated with cell overheating, researchers are making various attempts to develop a system to increase the efficiency of photovoltaic modules.

Fin-based systems and other passive cooling methods offer a sustainable way to dissipate heat efficiently without relying on external electricity. This article examines the optimization ...

The principle of bionic cooling for photovoltaic (PV) panels involves mimicking natural surface structures and biological heat dissipation mechanisms--such as animal cooling fins or plant ...

This study explains the active and passive cooling techniques for PV cells by fin parameter optimisation of heat dissipation. Computations were performed using CFD to compare the performance of three ...

This review paper provides a thorough analysis of cooling techniques for photovoltaic panels. It encompasses both passive and active cooling methods, including water and air cooling, ...
