Wind power usually declines during the summer months, but this July has been a particularly bad month for wind. Six of the 10 lowest days for wind power so far this year have ...

A methodology to compute wind power generation seasonal forecasts employing manufacturer-provided power curves has been described. Several challenges related to how ...

Winter is not universally windless: multiple studies show substantial wind energy potential in winter months, though there are important regional and episodic exceptions where wind power ...

Across the U.S. between January 2016 and August 2022, wind plant capacity factors reached their highest levels in March and April and were at their lowest in July and August, according ...

Because of the concentration of wind capacity in the Lower Plains, the national wind performance pattern follows the seasonal wind performance pattern of the Lower Plains quite closely:...

Nationally, wind plant performance tends to be highest during the spring and lowest during the mid- to late summer, while performance during the winter (November through February) is ...

In contrast, summer is the least productive season for wind energy. The reason lies in reduced temperature differences, as the land and sea temperatures stabilize, leading to weaker wind ...

Nationally, between January 2016 and August 2022, wind plant capacity factors peaked in March and April and were at their lowest in July and August.
