The invention relates to a breeze power generation device based on a torquigener nest, and solves the problems that an existing breeze power generation device is low in wind energy collection efficiency, ...

The invention relates to a breeze power generation device based on a Fugu obscurus nest, which effectively solves the problems that the wind energy collection efficiency of the...

A power generation tower and lift-type technology, which is applied in the field of vertical liftable breeze power generation towers, can solve problems such as inability to generate electricity with breeze, ...

First purpose of the present invention provides the breeze-type wind energy generator to generate a powerfuller electricity powerfuller than that of the current conventional wind energy...

Abstract The invention discloses an air collection device convenient for a breeze power generation device with carbon fiber blades to collect air.

The existing wind collecting device has limited improvement on wind speed, and in order to efficiently utilize low-speed breeze to generate power, a high-efficiency wind collecting...

The invention relates to wind power generation equipment, in particular to power generation equipment capable of gathering wind and adjusting breeze, and belongs to the technical field of...

Description technical field [0001] The invention belongs to the technical field of grid auxiliary equipment, and relates to a breeze energy collection device, in particular to a breeze energy collection device ...
